

LIKENESS : THE GAME

MILESTONE 01 STARTER BUILD / OVS PRODUCTION HANDOFF / V004

This document turns the existing LIKENESS V003 handoff into the first actionable build package. It does not replace the production bible. It creates the first safe execution layer: repository, Unreal skeleton, Three.js companion skeleton, data bridge, QA report, and stop condition before real gameplay work begins.

PROJECT	LIKENESS : THE GAME
VERSION	V004 - Milestone 01 Starter
ENGINE TARGET	Unreal Engine 5.7 plus Three.js web companion
STATUS	Foundation setup only
DO NOT DO YET	Final gameplay, final assets, Gaussian splat experiments, full character import

01 / Purpose

Milestone 01 is the bridge between planning and production. Its job is to make the project safe for agentic development before complex Blueprints, 3D assets, WebXR scenes, or AI-generated content are introduced.

The package assumes the V003 system is now the master handoff: core game bible, expansion modules, Gaussian splat staging, Higgsfield campaign prompts, Unreal reference guidance, and Blender MCP plus fal.ai asset fabrication.

OVS law carried forward

- Face is the budget.
- Room is the antagonist.
- Camera is a witness.
- Image must feel playable.
- Every system must be modular, replaceable, expandable, and inspectable.

02 / Required Read Order

- README_START_HERE.md
- docs/00_OVS_Production_Workflow.md
- docs/17_Milestone_01_Build_Kickoff.md
- agents/AGENTS.md
- agents/MILESTONE_01_AGENT_PROMPT.md
- data/*.csv
- unreal/milestone_01/M01_UNREAL_STARTER_PLAN.md
- web/milestone_01_starter/

03 / Milestone 01 Build Sequence

Step 01 - Repository Verification

Create or verify the top-level project structure. Initialize Git before any engine or web work. Commit the documentation and registry base before moving forward.

```
git init
git status
git add README_START_HERE.md docs agents data
git commit -m "chore: initialize LIKENESS game production foundation"
```

Step 02 - Unreal Skeleton

Create or verify the Unreal project, then set up only conceptual project structure. Do not import final characters, final motel assets, splats, or marketplace packs during this milestone.

```
/Content/OVS_LIKENESS/
Blueprints/
Characters/
Cinematics/
Data/
Environments/
Materials/
Meshes/
Props/
UI/
```

```
Audio/  
VFX/  
Tests/
```

Step 03 - First Graybox Map

Create one proof map: L_OVS_M01_Room14_Graybox. It needs only a player start, capsule or mannequin proxy, three wall proxies, one door proxy, one mirror proxy, one interactable prop proxy, and debug labels.

Step 04 - Three.js Web Companion

Use the starter in web/milestone_01_starter. It contains a minimal Vite/Three scene with OVS visual DNA, Room 14 placeholder geometry, project metadata loading, and a registry-ready public data folder.

```
cd web/milestone_01_starter  
npm install  
npm run dev
```

Step 05 - QA Report

Before stopping, the agent must create a report in qa/milestone_01/ using the included template. The report must include commands run, files created, files modified, tests passed, tests failed or skipped, risks, and the next prompt.

04 / Folder Additions In V004

PATH	FUNCTION
docs/17_Milestone_01_Build_Kickoff.md	Main build kickoff instructions.
agents/MILESTONE_01_AGENT_PROMPT.md	Copy-paste prompt for Codex, Claude Code, or another local agent.
agents/MILESTONE_01_ACCEPTANCE_REPORT_TEMPLATE.md	Report format the agent must complete before stopping.
data/milestone_01_task_board.csv	First task list with acceptance criteria.
unreal/milestone_01/M01_UNREAL_STARTER_PLAN.md	Unreal folder and first map plan.
web/milestone_01_starter/	Minimal Three.js companion starter.
scripts/create_milestone_01_scaffold.py	Safe folder creation utility that deletes nothing.

05 / Agent Stop Condition

The agent must stop after Milestone 01. It must not continue into mechanics, inventory, dialogue, tapes, mirror lag, final character import, Blender asset baking, Image-Blaster scenes, NanoGS imports, or Higgsfield campaign generation without user approval.

This protects the project from scope creep and makes each expansion module a controlled production decision rather than an automatic dependency.

06 / Milestone 01 Acceptance Checklist

- Git initialized or verified.
- Core folder structure exists.
- Unreal folder plan exists or project skeleton created.
- First graybox map plan is documented.
- Three.js starter exists with package.json, main.js, scene controller, style, and JSON metadata.
- CSV registries remain source of truth.
- QA report template exists.
- Agent prompt exists.
- No user files deleted.
- No final asset import performed.

07 / Copy-Paste Agent Kickoff

Use the included file `agents/MILESTONE_01_AGENT_PROMPT.md` as the source of truth. The condensed version below is included for fast handoff.

```
You are working on LIKENESS : THE GAME. Current job: Milestone 01 foundation only. Read
README_START_HERE.md, docs/17_Milestone_01_Build_Kickoff.md, agents/AGENTS.md, and data/*.csv. Initialize
or verify Git, create missing top-level folders, create or verify Unreal milestone folder plan, create the
Three.js starter, add JSON registry samples, create qa/milestone_01/SESSION_REPORT.md, run safe validation
commands, commit the scaffold, then stop and report exactly what changed. Do not build gameplay systems, do
not import final assets, and do not invent new lore.
```

08 / Best Next Move After V004

Run Milestone 01 exactly once as a foundation pass. After it passes QA, the next best package is Milestone 02: Room 14 graybox interaction loop. That should introduce only door, mirror, inspect, and camera proof systems. Dialogue, tapes, doubles, character imports, splats, Blender bakes, and campaign assets should stay gated until later milestones.

09 / Final Note

V004 is designed as the production lock between planning and execution. It gives Claude Code, Codex, or another coding agent a precise starting lane. It also keeps the Unreal game, web companion, AI asset pipeline, and OVS production bible under one common naming system and visual law.
